

Implementing HTML table (20 points)

Follow the following instructions for chapter 5 exercise (this exercise requires two files: HTML and CSS files. The HTML is provided and must not be changed):

- The HTML file provided is called *index.html*
- Name your CSS file *style.css* (you may place the file in a folder called *css*)
- Create a div (the gray box/container shown below) with width of 500 pixels, border one pixel solid black, padding top and bottom 20 pixels each and background color #CCC.
Use the following to center the container inside browser: **margin: 10px auto;**
- You must use pseudo-class selectors to accomplish the style of the table (second column color is #D90000 and the every third row of last column excluding the header color is #FFFF4C)
- Use *hover* pseudo-class to highlight the row (using #BFEFFF color) as the mouse hovers it. See if you can avoid highlighting when mouse hovers the table title, in other words, the title should not be highlighted when the mouse move over it.
